

### Features

- Output Current: Up to 2A
- Output Voltage: 0.6V to  $V_{IN}$
- Input Voltage: 2.7V to 5.5V
- Peak Efficiency up to 95%
- 42  $\mu$ A (Typ) No Load Quiescent Current
- Shutdown Current: <1  $\mu$ A
- 100% Duty Cycle Operation
- 1.5MHz Switching Frequency
- Internal Soft Start
- No external Compensation Required
- Current Limit Protection
- Thermal Shutdown
- SOP-8 Package

### Applications

- 5V or 3.3V Point of Load Conversion
- Telecom/Networking Equipment
- Set Top Boxes
- Storage Equipment
- Video Cards
- DDR Power Supply

### Description

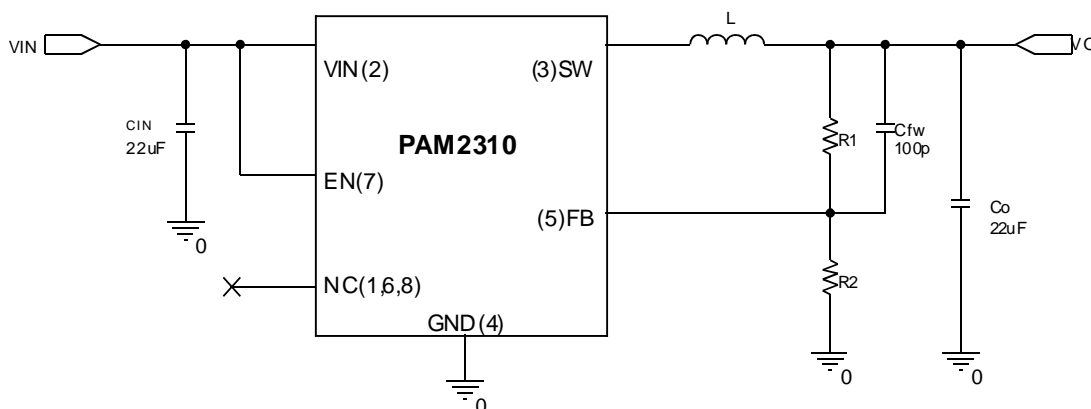

The PAM2310 is a 2A step-down DC-DC converter. At heavy load, the constant-frequency PWM control performs excellent stability and transient response. No external compensation components are required.

The PAM2310 supports a range of input voltages from 2.7V to 5.5V, allowing the use of a single Li+/Li-polymer cell, multiple Alkaline/NiMH cell, and other standard power sources. The output voltage is adjustable from 0.6V to the input voltage. The PAM2310 employs internal power switch and synchronous rectifier to minimize external part count and realize high efficiency. During shutdown, the input is disconnected from the output and the shutdown current is less than 1  $\mu$ A. Other key features include over-temperature and short circuit protection, and under-voltage lockout to prevent deep battery discharge.

The PAM2310 delivers 2A maximum output current while consuming only 42  $\mu$ A of no-load quiescent current. Ultra-low RDS(ON) integrated MOSFETs and 100% duty cycle operation make the PAM2310 an ideal choice for high output voltage, high current applications which require a low dropout threshold.

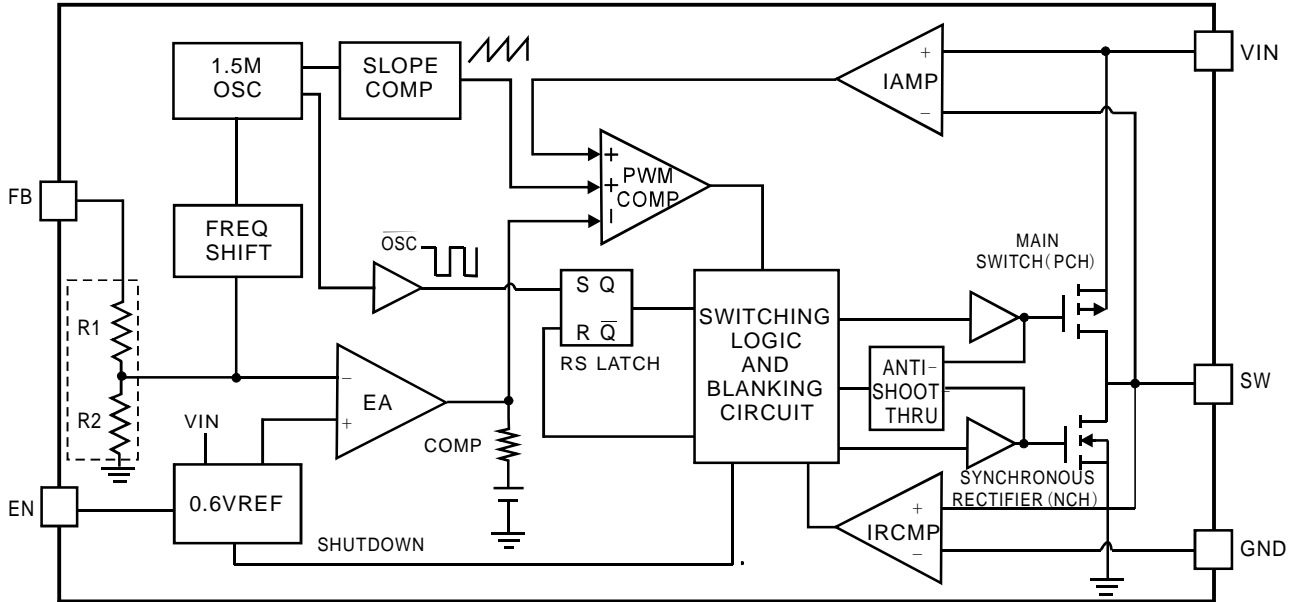

The PAM2310 is available in SOP-8 package.

### Typical Application

$$V_o = 0.6 \times \left( 1 + \frac{R1}{R2} \right)$$

### Block Diagram

### Pin Configuration & Marking Information

### Pin Description

Name	Pin Number	Function
NC	1	No Connected
VIN	2	Bias supply. Chip main power supply pin
SW	3	The drains of the internal main and synchronous power MOSFET.
GND	4	GND
FB	5	Feedback voltage to internal error amplifier, the threshold voltage is 0.6V.
NC	6	No Connected
EN	7	Enable control input. Force this pin voltage above 1.5V, enables the chip, and below 0.3V shuts down the device.
NC	8	No Connected

### Absolute Maximum Ratings

These are stress ratings only and functional operation is not implied. Exposure to absolute maximum ratings for prolonged time periods may affect device reliability. All voltages are with respect to ground.

Input Voltage $V_{IN}$ .....	6V	Maximum Junction Temperature.....	150°C
SW Pin Voltage.....	-0.3V to ( $V_{IN}+0.3V$ )	Storage Temperature Range.....	-65°C to 150°C
FB Pin Voltage.....	-0.3V to ( $V_{IN}+0.3V$ )	Soldering Temperature.....	300°C, 5sec
EN Pin Voltage.....	-0.3V to 6V		

### Recommended Operating Conditions

Supply Voltage.....	2.7V to 5.5V	Junction Temperature Range.....	-40°C to 125°C
		Ambient Temperature Range.....	-40°C to 85°C

### Thermal Information

Parameter	Symbol	Package	Maximum	Unit
Thermal Resistance (Junction to Ambient)	$\theta_{JA}$	SOP-8	90	°C/W
Thermal Resistance (Junction to Case)	$\theta_{JC}$	SOP-8	11	°C/W
Internal Power Dissipation (@ $T_A=25^\circ\text{C}$ )	$P_D$	SOP-8	1100	mW

# PAM2310

## 2A Low Noise Step-Down DC-DC Converter

### Electrical Characteristic

$T_A=25^{\circ}\text{C}$ ,  $V_{IN}=5.0\text{V}$ ,  $V_O=1.8\text{V}$ ,  $C_{in}=22\mu\text{F}$ ,  $C_o=22\mu\text{F}$ ,  $L=2.2\mu\text{H}$ , unless otherwise noted.

PARAMETER	SYMBOL	Test Conditions	MIN	TYP	MAX	UNITS
Input Voltage Range	$V_{IN}$		2.7		5.5	V
Output Voltage Range	$V_O$		0.6		$V_{IN}$	V
Regulated Output Voltage Accuracy	$V_O$	$I_O = 0$ to 2A, $V_{IN}=2.7\text{V}$ to 5.5V	-2		+2	%
Regulated Feedback Voltage	$V_{FB}$		0.588	0.6	0.612	V
FB Leakage Current	$I_{FB}$	$V_O=1\text{V}$			0.2	$\mu\text{A}$
Output Voltage Line Regulation	LNR	$V_{IN} = 2.7\text{V}$ to 5V		0.2		%/V
Output Voltage Load Regulation	LDR	$I_O=0\text{A}$ to 2A		0.5		%/A
Quiescent Current	$I_Q$	No load		42	90	$\mu\text{A}$
Shutdown Current	$I_{SD}$	$V_{EN} = 0\text{V}$			1	$\mu\text{A}$
Peak Inductor Current	$I_{LM}$		3			A
Oscillator Frequency	$f_{OSC}$			1.5		MHz
Drain-Source On-State Resistance	$R_{DS(ON)}$	$I_{sw}=100\text{mA}$	High Side		90	$\text{m}\Omega$
			Low Side		70	$\text{m}\Omega$
Start up Time	$t_s$	From enable to output regulation		0.5		ms
EN Threshold High	$V_{EH}$		1.5			V
EN Threshold Low	$V_{EL}$				0.3	V
EN Leakage Current	$I_{EN}$	$V_{IN}=V_{EN} = 0\text{V}$	-1.0		1.0	$\mu\text{A}$
Over Temperature Protection	OTP			150		$^{\circ}\text{C}$
OTP Hysteresis	OTH			30		$^{\circ}\text{C}$

### Typical Performance Characteristics

$T_A=25^\circ\text{C}$ ,  $C_{IN}=22\mu\text{F}$ ,  $C_O=22\mu\text{F}$ , unless otherwise noted.

### Typical Performance Characteristics

$T_A=25^{\circ}\text{C}$ ,  $C_{IN}=22\mu\text{F}$ ,  $C_O=22\mu\text{F}$ , unless otherwise noted.

### Typical Performance Characteristics

$T_A=25^\circ\text{C}$ ,  $C_{IN}=22\mu\text{F}$ ,  $C_O=22\mu\text{F}$ , unless otherwise noted.

### Application Information

The basic PAM2310 application circuit is shown in Page 1. External component selection is determined by the load requirement, selecting L first and then Cin and Cout.

#### Inductor Selection

For most applications, the value of the inductor will fall in the range of 1μH to 2.7μH. Its value is chosen based on the desired ripple current and efficiency. Large value inductors lower ripple current and small value inductors result in higher ripple currents. Higher Vin or Vout also increases the ripple current as shown in equation 2A reasonable starting point for setting ripple current is ΔIL = 1.2A (40% of 2A).

$$\Delta I_L = \frac{1}{(f)(L)} V_{OUT} \left( 1 - \frac{V_{OUT}}{V_{IN}} \right) \quad (1)$$

The DC current rating of the inductor should be at least equal to the maximum load current plus half the ripple current to prevent core saturation. Thus, a 4.2A rated inductor should be enough for most applications (2A + 1.2A). For better efficiency, choose a low DC-resistance inductor.

Vo	1.2V	1.5V	1.8V	2.5V	3.3V
L	1.2μH	1.5μH	2.2μH	2.2μH	2.2μH

#### CIN and COUT Selection

In continuous mode, the source current of the top MOSFET is a square wave of duty cycle Vout/Vin. To prevent large voltage transients, a low ESR input capacitor sized for the maximum RMS current must be used. The maximum RMS capacitor current is given by:

$$C_{IN} \text{ required } I_{RMS} \cong I_{OMAX} \frac{[V_{OUT}(V_{IN} - V_{OUT})]^{1/2}}{V_{IN}}$$

This formula has a maximum at Vin = 2Vout, where IRMS = IOUT/2. This simple worst-case condition is commonly used for design because even significant deviations do not offer much relief. Note that the capacitor manufacturer's ripple current ratings are often based on 2000 hours of life. This makes it advisable to further derate the capacitor, or choose a capacitor rated at a higher temperature than required. Consult the manufacturer if there is any question.

The selection of Cout is driven by the required effective series resistance (ESR).

Typically, once the ESR requirement for Cout has been met, the RMS current rating generally far exceeds the I<sub>ripple</sub>(P-P) requirement. The output ripple ΔVout is determined by:

$$\Delta V_{out} \approx \Delta I_L (ESR + 1/8fC_{out})$$

Where f = operating frequency, C<sub>out</sub> = output capacitance and ΔIL = ripple current in the inductor. For a fixed output voltage, the output ripple is highest at maximum input voltage since ΔIL increases with input voltage.

#### Using Ceramic Input and Output Capacitors

Higher values, lower cost ceramic capacitors are now becoming available in smaller case sizes. Their high ripple current, high voltage rating and low ESR make them ideal for switching regulator applications. Using ceramic capacitors can achieve very low output ripple and small circuit size.

When choosing the input and output ceramic capacitors, choose the X5R or X7R dielectric formulations. These dielectrics have the best temperature and voltage characteristics of all the ceramics for a given value and size.

#### Thermal consideration

Thermal protection limits power dissipation in the PAM2310. When the junction temperature exceeds 150°C, the OTP (Over Temperature Protection) starts the thermal shutdown and turns the pass transistor off. The pass transistor resumes operation after the junction temperature drops below 120°C.

For continuous operation, the junction temperature should be maintained below 125°C. The power dissipation is defined as:

$$P_D = I_o^2 \frac{V_o R_{DS(ON)H} + (V_{IN} - V_o) R_{DS(ON)L}}{V_{IN}} + (t_{sw} F_s I_o + I_q) V_{IN}$$

I<sub>o</sub> is the step-down converter quiescent current. The term tsw is used to estimate the full load step-down converter switching losses.

For the condition where the step-down converter is in dropout at 100% duty cycle, the total device dissipation reduces to:

$$P_D = I_O^2 R_{DS(ON)} + I_Q V_{IN}$$

Since  $R_{DS(ON)}$ , quiescent current, and switching losses all vary with input voltage, the total losses should be investigated over the complete input voltage range. The maximum power dissipation depends on the thermal resistance of IC package, PCB layout, the rate of surrounding airflow and temperature difference between junction and ambient. The maximum power dissipation can be calculated by the following formula:

$$P_D = \frac{T_{J(MAX)} - T_A}{\theta_{JA}}$$

Where  $T_{J(max)}$  is the maximum allowable junction temperature 125°C.  $T_A$  is the ambient temperature and  $\theta_{JA}$  is the thermal resistance from the junction to the ambient. Based on the standard JEDEC for a two layers thermal test board, the thermal resistance  $\theta_{JA}$  of QFN3X3 68°C/W and SOP-8 90°C/W respectively. The maximum power dissipation at  $T_A = 25^\circ\text{C}$  can be calculated by following formula:

$$P_D = (125^\circ\text{C} - 25^\circ\text{C}) / 68^\circ\text{C/W} = 1.47\text{W (QFN3X3)}$$

$$P_D = (125^\circ\text{C} - 25^\circ\text{C}) / 90^\circ\text{C/W} = 1.11\text{W (SOP-8)}$$

### Setting the Output Voltage

The internal reference is 0.6V (Typical). The output voltage is calculated as below:

The output voltage is given by Table 1.

$$V_O = 0.6 \times \left( 1 + \frac{R1}{R2} \right)$$

**Table 1:** Resistor selection for output voltage setting

V <sub>o</sub>	R1	R2
1.2V	150k	150k
1.5V	225k	150k
1.8V	300k	150k
2.5V	475k	150k
3.3V	680k	150k

### 100% Duty Cycle Operation

As the input voltage approaches the output voltage, the converter turns the P-channel transistor continuously on. In this mode the output voltage is equal to the input voltage minus the voltage drop across the P - channel transistor:

$$V_{OUT} = V_{IN} - I_{LOAD} (R_{dson} + R_L)$$

where  $R_{dson}$  = P-channel switch ON resistance,  $I_{LOAD}$  = Output current,  $R_L$  = Inductor DC resistance

### UVLO and Soft-Start

The reference and the circuit remain reset until the VIN crosses its UVLO threshold.

The PAM2310 has an internal soft-start circuit that limits the in-rush current during start-up. This prevents possible voltage drops of the input voltage and eliminates the output voltage overshoot. The soft-start acts as a digital circuit to increase the switch current in several steps to the P-channel current limit (3000mA).

### Short Circuit Protection

The switch peak current is limited cycle-by-cycle to a typical value of 3000mA. In the event of an output voltage short circuit, the device operates with a frequency of 500kHz and minimum duty cycle, therefore the average input current is typically 500mA.

### Thermal Shutdown

When the die temperature exceeds 150°C, a reset occurs and the reset remains until the temperature decrease to 120°C, at which time the circuit can be restarted.
